

Python Basic Interview Questions – 5

1. What is an operator in Python?

Answer: An operator is a symbol used to perform an operation on values.

Example: + is used for addition.

2. What is the use of + in Python?

Answer: The + operator is used to add numbers or join strings.

Example: 5 + 3 gives 8.

3. What is the use of len() in Python?

Answer: len() is used to find the number of characters or items.

Example: len("Hello") gives 5.

4. What is None in Python?

Answer: None represents the absence of a value.

Example: result = None

5. What is an error in Python?

Answer: An error occurs when Python cannot execute the code correctly.

Example: Using an undefined variable can cause an error.
